Classic Menu Board

Queue Status Board

Order Summary Board

1. Overview

This guide explains how the **Pizza Hut** brand is configured in Personalisation Hub, and how to set up (or reproduce) each of its three Offer Boards: the **Classic Menu Board**, the **Queue Status Board**, and the **Order Summary Board**. It also covers the companion mobile ordering screen that feeds the Order Summary Board live data.

In Personalisation Hub, every brand lives under **Brands / Suppliers** and carries its own name, logo, currency, and colour palette. A brand's menu items live under **Products / Assets** and are organised by **Categories** and by **Menu Type** tags (e.g. Lunch, Dinner, Drinks, Today's Specials). Each brand can have up to three **Offer Board** templates, configured from *Brands / Suppliers* → *open a brand* → *Manage Offer Boards*.

Current Pizza Hut brand configuration

Setting	Value
Brand name	Pizza Hut
Currency	\$
Brand colour palette	Red #E91C24 , Black #000000
Menu items	70 items across 14 categories
Categories	Pan Pizza, Stuffed Crust, Thin 'N Crispy, Specialty Pizzas, Wings, Pasta, Melts & Sandwiches, Sides & Bread, Dips, Salads, Desserts, Soft Drinks, Kids Meals, Today's Specials
Menu types	Lunch, Dinner, Drinks, Today's Specials
Offer Boards configured	Classic Menu Board · Queue Status Board · Order Summary Board

Where to find it: HQ Admin → Brands / Suppliers → **Pizza Hut**. The row shows a chip for each configured Offer Board — click a chip to copy its live board URL, or open the brand to edit settings.

Offers Dashboard — shows the live item/category counts and any Offer Boards that have checked in within the last 48 hours.

2. Classic Menu Board

How it works

The Classic Menu Board is a traditional tiled grid menu board. It shows every item that matches the board's configured Menu Type filter, tiled into a grid sized for the display's orientation, with the brand logo and a title bar at the top and a live clock/date. When there are more items than fit on one screen, the board automatically paginates and **rotates to the next page every 8 seconds** with a progress bar, cycling continuously. Each item tile shows its photo, price, category badge and name, and is greyed out with a "SOLD OUT" stamp if the item is marked out of stock for the store.

Classic Menu Board — landscape, mid-rotation (Specialty Pizzas / Stuffed Crust / Thin 'N Crispy)

Classic Menu Board — portrait orientation

Setup steps

- 1 Go to **Brands / Suppliers** and open the brand (e.g. Pizza Hut).
- 2 Switch to the **Manage Offer Boards** tab and click **+ Add Template** (or **Edit** on an existing board).
- 3 Choose **Classic Menu Board** from the template library.
- 4 Set the **Header Layout**: show/hide the header bar, icon position, and whether the logo or an icon is used. Leave **Header Title** blank to fall back to the brand name automatically.
- 5 Set the **Colour Scheme** — 10 tokens (header background/text, accent, category badge, page background, item card background, item name text, description text, price text, clock text/background). For Pizza Hut these are set to the brand red `#E91C24` for header/accent/price and white/black for text and backgrounds.
- 6 Choose the **Menu Type filter** — which item tags this board shows. Pizza Hut's Classic Menu Board is set to `Lunch, Dinner, Drinks, Today's Specials` (i.e. the full catalogue). Optionally narrow further with a **Category filter**.
- 7 Set the **grid layout** (columns, rows, max items per page) separately for portrait and landscape. Pizza Hut uses 5×3 (15 items/page) landscape and 3×5 portrait.
- 8 Toggle the **clock**, choose a **time format** (British/US/system), and set **Campaign Mode** (filter vs. override, for promotional campaign data from the PH API).

- 9 Click **Save Template**, then **Save Changes** on the brand modal to persist.
- 10 Click **Copy URL** on the board's row to get its deployable URL, and paste it into the display/CMS with real Store Code and Device ID values.

```
menu-board.html?brand=Pizza+Hut&template=classic-menu-board&store=${StoreCode}&menu=lunch,dinner,drinks,specials&device=${UniqueDeviceID}&orientation=landscape
```

Note: `${StoreCode}` and `${UniqueDeviceID}` are Personalisation Hub platform tokens, automatically substituted with the real store/device identifiers when the board is deployed to a physical display.

3. Queue Status Board

How it works

The Queue Status Board uses the same rendering engine as the Classic Menu Board, but is intended for a small, focused set of items rather than a full catalogue — for example a short list of today's deals or featured call-outs. When 10 or fewer items match the board's filter, the layout **automatically switches to a dynamic, large-tile layout** (rather than the fixed grid configured for the brand), so a handful of items always look deliberate and legible rather than lost in a big empty grid. For Pizza Hut, this board is filtered to the **Today's Specials** menu type, so it rotates through the current deals (Big Dinner Box, Carside Family Deal, \$7 Deal Lover's, etc.).

Queue Status Board — landscape, showing Today's Specials

Setup steps

- 1 From the brand's **Manage Offer Boards** tab, click **+ Add Template** and choose **Queue Status Board** from the template library.
- 2 Configure the header and colour scheme exactly as for the Classic Menu Board (Section 2, steps 4–5).
- 3 Set the **Menu Type** filter to a small, focused tag — e.g. **Today's Specials** — rather than the full catalogue, so the auto-sized layout stays clean. This is the key difference from the Classic Menu Board.
- 4 Set a custom **Sub-header** (e.g. "Today's Deals") to describe what the board is showing.
- 5 **Save Template**, then **Save Changes**, then **Copy URL** to deploy.

```
menu-board.html?brand=Pizza+Hut&template=queue-status-board&store=${StoreCode}&menu=specials&device=${UniqueDeviceID}&orientation=landscape
```

4. Order Summary Board

How it works

The Order Summary Board is a **standalone, real-time** board — it doesn't show the menu catalogue at all. Instead, it's paired with the companion mobile ordering screen (`order.html`) running on a tablet at the till or on a customer's phone: as items are added to the order, the board updates **instantly** (via a live Firestore listener keyed on the device ID), showing each item, quantity and running total. When the order is placed and completed, the board briefly confirms and then clears itself back to a branded empty state ("No Items in your Takeout Bag"), ready for the next customer. If the board goes 60 seconds without an update, it also resets automatically.

Order Summary Board — live, mid-order

Order Summary Board — idle / empty state

Setup steps

- 1 From the brand's **Manage Offer Boards** tab, click **+ Add Template** and choose **Order Summary Board** — note it's flagged "standalone" in the template library, meaning it has no Menu Type or grid-layout options.
- 2 Configure only the header (logo, title) and colour scheme — the same 10 colour tokens as the other boards.
- 3 **Save Template**, then **Save Changes**.
- 4 Deploy the board URL to the customer-facing display, and deploy `order.html` (with the **same** Store Code and Device ID) to the staff tablet or customer's phone used to build the order.

```
order-summary.html?brand=Pizza+Hut&store=${StoreCode}&device=${UniqueDeviceID}
```

```
order.html?store=${StoreCode}&device=${UniqueDeviceID}
```

Important: the Store Code and Device ID must match *exactly* between `order.html` and `order-summary.html` — they're how the two screens find the same live cart. The Order Summary Board always uses the first configured brand and does not take a `template=` parameter.

5. URL Parameter Reference

Parameter	Used by	Description
brand	All boards	Brand name (matched case-insensitively), e.g. <code>Pizza Hut</code> .
template	Classic Menu, Queue Status	Which of the brand's Offer Board templates to render, e.g. <code>classic-menu-board</code> .
store	All boards	Store code — enables out-of-stock lookups and the "store name" greeting. PH token: <code>\${StoreCode}</code> .
device	All boards	Unique device/screen ID. Required if <code>store</code> isn't set; also the live-cart key for the Order Summary Board. PH token: <code>\${UniqueDeviceID}</code> .
menu	Classic Menu, Queue Status	Comma-separated Menu Type filter, e.g. <code>lunch,dinner</code> . Required — the board shows an error screen without it. PH token: <code>\${MenuType}</code> .
orientation	Classic Menu, Queue Status	<code>landscape</code> or <code>portrait</code> — selects which grid layout config to use.

Manage Offer Boards — the three configured templates for Pizza Hut

6. What Was Reviewed & Tested

- ✓ Brand identity (name, logo, colour palette) confirmed as Pizza Hut across all three boards, including per-template colour overrides.
- ✓ Full menu catalogue replaced with 70 Pizza Hut items across 14 categories (pizzas, wings, pasta, sides, dips, salads, desserts, drinks, kids meals, deals).
- ✓ Classic Menu Board: verified pagination/rotation, portrait and landscape layouts, clock on/off toggle, and header title/colour settings all update the live board correctly.
- ✓ Queue Status Board: verified the small-set auto-layout, colour overrides, and header copy.
- ✓ Order Summary Board: verified live sync from `order.html` — items add instantly, totals calculate correctly, "Place Order" completes and clears the board back to its empty state.
- ✓ Offers Dashboard correctly tracks both boards as "Live" after being viewed, with accurate item/page counts per Menu Type.

Notes & expected behaviour

API Error banner: in this demo environment there is no live Personalisation Hub API endpoint configured, so boards show a small "API Error — All configured API endpoints failed" banner and fall back to the local catalogue automatically. This is expected without a configured endpoint under *Settings* → *PH API Endpoints*, and does not affect the board's normal operation.

Order confirmation screen colour: the "Your Order #..." confirmation screen in `order.html` uses a fixed neutral colour regardless of brand — this is an intentional platform-wide "success" state, not a Pizza Hut styling gap.

Item ordering: items within a page are sorted alphabetically by category name, then by item name — category order isn't independently configurable from the brand's Categories list.
